

Vibrational Spectroscopy

By: Dr Nikhil Kaushik

Basic Concept : Gives information about the functional groups in a molecule

IR Spectroscopy

I. Introduction

A. Spectroscopy is the study of the interaction of matter with the electromagnetic spectrum

1. Electromagnetic radiation displays the properties of both particles and waves
2. The particle component is called a *photon*
3. The energy (**E**) component of a photon is proportional to the frequency. Where **h** is Planck's constant and ν is the frequency in Hertz (cycles per second)

$$E = h\nu$$

4. The term "photon" is implied to mean a small, massless particle that contains a small wave-packet of EM radiation/light – we will use this terminology in the course

IR Spectroscopy

I. Introduction

C. The IR Spectroscopic Process

1. The quantum mechanical energy levels observed in IR spectroscopy are those of *molecular vibration*
2. We perceive this vibration as heat
3. When we say a *covalent bond* between two atoms is of a certain length, we are citing an average because the bond behaves as if it were a vibrating spring connecting the two atoms
4. For a simple diatomic molecule, this model is easy to visualize:

Infrared Spectroscopy

region of infrared that is most useful lies between
(4000-625 cm^{-1})

depends on transitions between vibrational
energy states

stretching

bending

Stretching Vibrations

Stretching vibrations

Symmetric

Asymmetric

Bending Vibrations

IR Spectroscopy

I. Introduction

C. The IR Spectroscopic Process

5. There are two types of bond vibration:

- **Stretch** – Vibration or oscillation along the line of the bond

symmetric

asymmetric

- **Bend** – Vibration or oscillation not along the line of the bond

scissor

rock

in plane

twist

wag

out of plane

symmetric

asymmetric

In-plane scissoring

Out-of-plane twisting

In-plane rocking

Out-of-plane wagging

Symmetric stretching

Antisymmetric stretching

Scissoring

Rocking

Wagging

Twisting

Infrared Spectroscopy

C. The IR Spectroscopic Process

6. As a covalent bond oscillates – due to the oscillation of the dipole of the molecule – a varying electromagnetic field is produced

7. The greater the dipole moment change through the vibration, the more intense the EM field that is generated

PRINCIPAL MODES OF VIBRATION

$3N-6$ possible normal modes of vibration

N = number of atoms in a molecule

Degrees of freedom = $3N$

H₂O for example

- 3 atoms

- Degrees of freedom = $3 \times 3 = 9$

- Normal modes of vibration = $9-6 = 3$

The Duck

PRINCIPAL MODES OF VIBRATION

Linear Molecules

- Cannot rotate about the bond axis
- Only 2 degrees of freedom describe rotation

$3N-5$ possible normal modes of vibration

CO₂ for example

- 3 atoms
- Normal modes of vibration = $9-5 = 4$

The Duck

FUNDAMENTAL TRANSITIONS

Overtone

- - Excitation from ground state to higher energy states
- - Result in overtone bands that are weaker than fundamental
- - Frequencies are integral multiples of fundamental absorption
- - Fewer peaks are seen than predicted on spectra due to IR-inactive vibrations, degenerate vibrations, weak vibrations
- - Additional peaks may be seen due to overtones

The Duck

Infrared Absorbance

Thermo Nicolet

FT-IR System

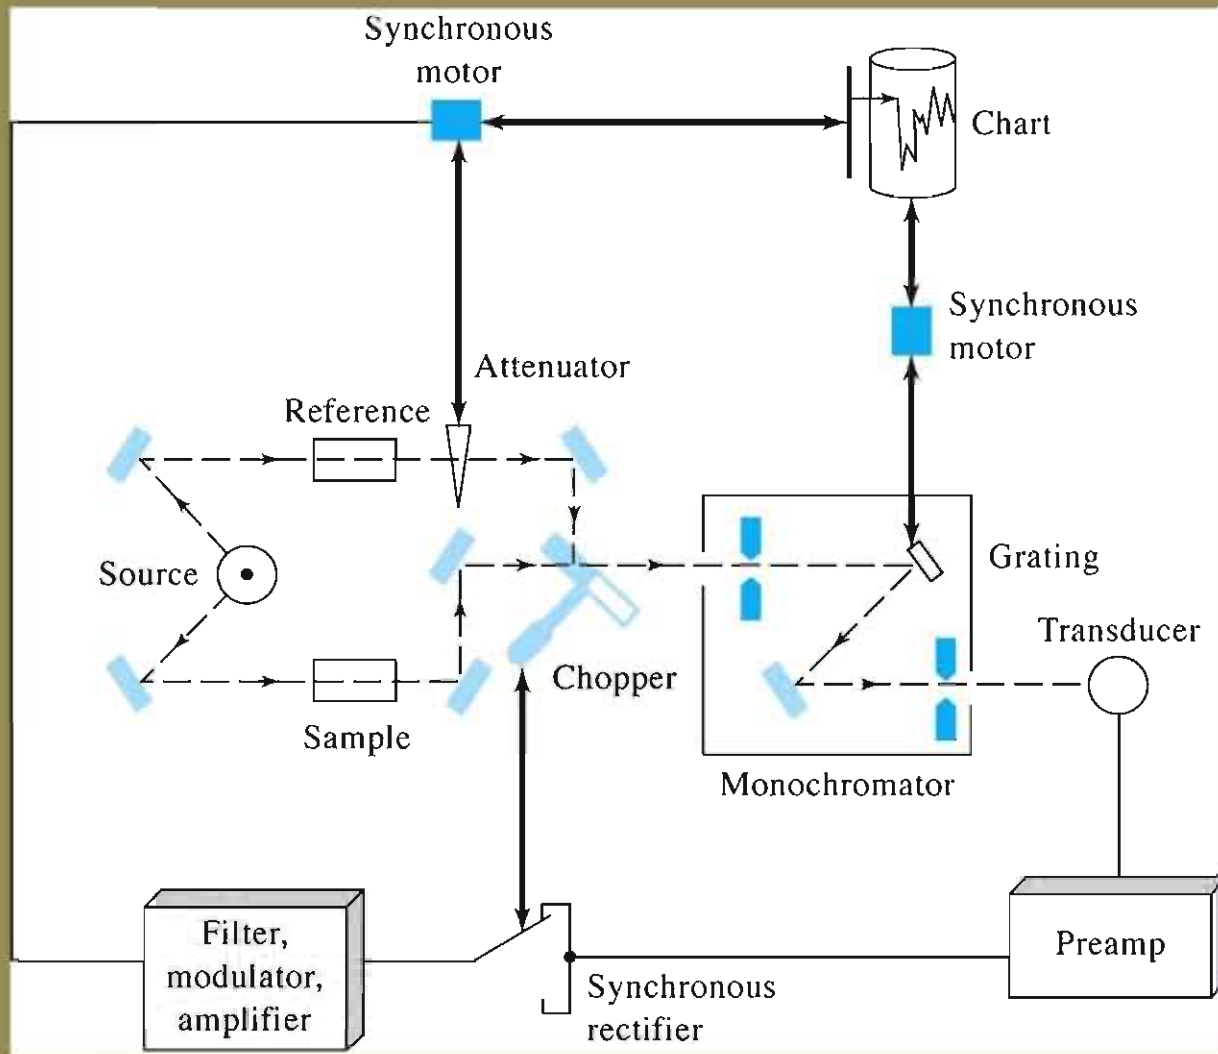

Optical Bench

C) Instrumentation

1.) Basic Design

- normal IR instrument similar to UV-vis
- main differences are light source & detector

Infrared Spectroscopy

IR Absorptions

- Bonds absorb in four predictable regions of an IR spectrum.

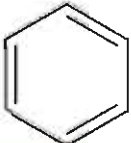

Figure 14.10 Summary:
The four regions of the IR
spectrum

Infrared Spectroscopy

IR Absorptions

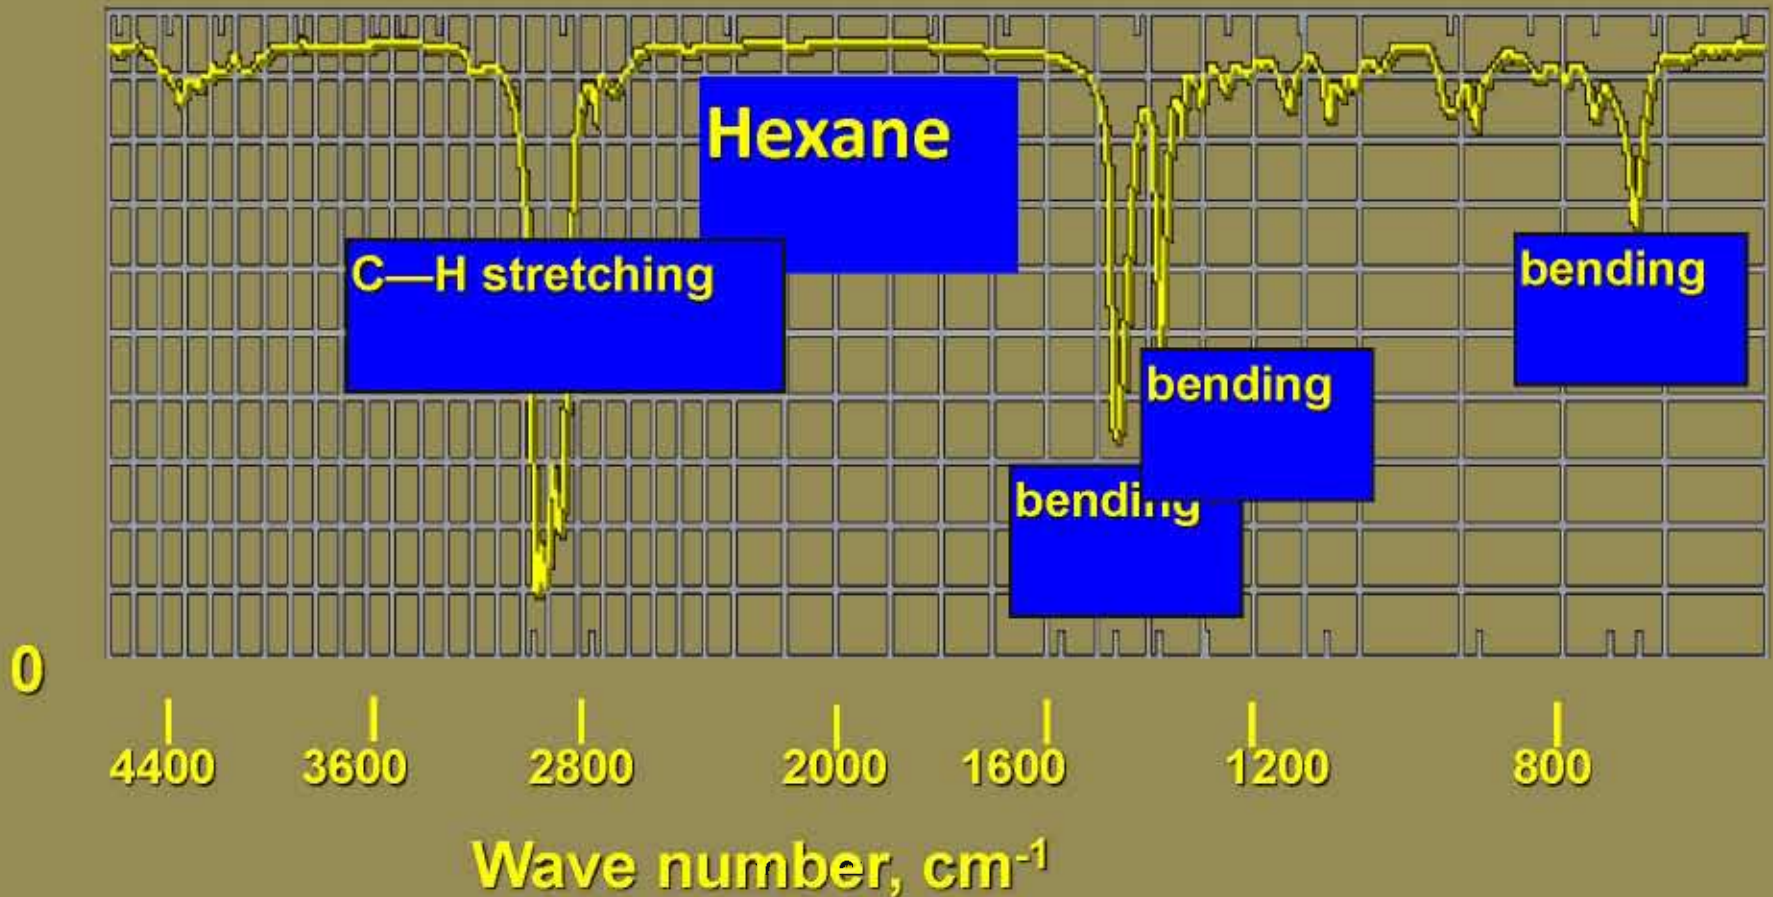

TABLE 14.2 Important IR Absorptions

Bond type	Approximate $\tilde{\nu}$ (cm^{-1})	Intensity
O-H	3600–3200	strong, broad
N-H	3500–3200	medium
C-H	~3000	
• $\text{C}_{sp^3}\text{-H}$	3000–2850	strong
• $\text{C}_{sp^2}\text{-H}$	3150–3000	medium
• $\text{C}_{sp}\text{-H}$	3300	medium
$\text{C}\equiv\text{C}$	2250	medium
$\text{C}\equiv\text{N}$	2250	medium
$\text{C}=\text{O}$	1800–1650 (often ~1700)	strong
$\text{C}=\text{C}$	1650	medium
	1600, 1500	medium

Abbreviated Table of Group Frequencies for Organic Groups

Bond	Type of Compound	Frequency Range, cm^{-1}	Intensity
C-H	Alkanes	2850-2970	Strong
C-H	Alkenes 	3010-3095 675-995	Medium strong
C-H	Alkynes 	3300	Strong
C-H	Aromatic rings	3010-3100 690-900	Medium strong
O-H	Monomeric alcohols, phenols	3590-3650	Variable
	Hydrogen-bonded alcohols, phenols	3200-3600	Variable, sometimes broad
	Monomeric carboxylic acids	3500-3650	Medium
	Hydrogen-bonded carboxylic acids	2500-2700	broad
N-H	Amines, amides	3300-3500	medium
C=C	Alkenes	1610-1680	Variable
C=C	Aromatic rings	1500-1600	Variable
$\text{C}\equiv\text{C}$	Alkynes	2100-2260	Variable
C-N	Amines, amides	1180-1360	Strong
$\text{C}\equiv\text{N}$	Nitriles	2210-2280	Strong
C-O	Alcohols, ethers, carboxylic acids, esters	1050-1300	Strong
C=O	Aldehydes, ketones, carboxylic acids, esters	1690-1760	Strong
NO_2	Nitro compounds	1500-1570 1300-1370	Strong

Infrared Absorption Frequencies

Structural unit	Frequency, cm^{-1}
Stretching vibrations (single bonds)	
O—H (alcohols)	3200-3600
O—H (carboxylic acids)	3000-3100

First examine the absorption bands in the vicinity of
4000-3000 cm^{-1}
